

Operations runbook (patching, incidents, disk, rollback)

Day-2 operations (patch, incident, disk)

SOW item 5/6. Client Linux admin / platform on-call.

1. Monthly OS patch window

Step	Action
1	Open standard change CHG-XXXX
2	<code>sudo dnf update --security on runner + runtime</code>
3	Reboot if kernel updated: <code>sudo shutdown -r +5</code>
4	Post-reboot: <code>systemctl --failed; podman ps</code>
5	Close change with evidence screenshot

Window: Second Sunday 02:00–06:00 local (industry default).

2. Container service restart

```
sudo systemctl restart <service>.container
sudo journalctl -u <service>.service -f
```

Service	Unit
Gorobi API	<code>gorobi.container</code>
Dagster	<code>dagster.container</code>
nginx	<code>nginx.container</code>

3. Disk full (runtime / ingestion)

Step	Action
1	<code>df -h</code> ; identify mount (/data , /var/lib/containers)
2	<code>podman system prune -f</code> (runner only — not prod runtime without approval)
3	Archive old ingestion files per retention policy
4	Expand data disk in Azure portal + grow partition
5	Post-incident: tune retention / alerts

Alert threshold: 80% warning; 90% critical.

4. Failed GitHub runner job

Symptom	Action
Queue stuck	<code>sudo systemctl restart actions-runner</code>
Disk full on runner	Prune build cache; expand OS disk
ACR login fail	<code>az login --identity -u \$UAMI_ID</code> ; check UAMI RBAC
Malicious PR	Isolate runner; rotate credentials; security ticket

5. ACR pull failure on runtime

```
az login --identity -u $UAMI_ID
az acr login --name <acr>
podman pull <acr>.azurecr.io/gorobi:<tag>
```

Cause	Fix
PE DNS	Fix privatelink DNS zone
Quarantine	Complete security scan in ACR
Wrong tag	Redeploy correct sha

6. SELinux denial

```
sudo ausearch -m avc -ts recent
sudo setsebool -P <bool> on # only if in standards doc
```

Document new contexts in appendix.

7. Incident severity

Sev	Example	Response
P1	Prod runtime down; trading API unreachable	15m acknowledge; bridge call
P2	UAT deploy fail	1h acknowledge
P3	Dev runner flake	Next business day

8. Break-glass

Follow . Log all actions in ticket.

9. Evidence for audit

Retain 90 days:

- Change tickets linked to deploys
- `journalctl` exports for P1 incidents
- PIM activation logs for human access
