

Promotion runbook (dev → UAT → prod)

Runbook: Image build and environment promotion

SOW item 5/6. Client executes. Opinionated banking flow: dev → UAT → prod.

Preconditions

- ☐ Runner VM online; `actions-runner` active
 - ☐ Runtime VM online; quadlet units enabled
 - ☐ ACR reachable from both VMs (PE + UAMI)
 - ☐ GitHub Environment reviewers configured for `uat` and `prod`
 - ☐ Change ticket approved (UAT/prod)
-

1. Build and push (dev)

Trigger: Push to `main` or manual `workflow_dispatch`

```
# On runner VM - normally via GitHub Actions
cd /opt/actions-runner/_work/<repo>/<repo>
./build/scripts/build-push-images.sh --env dev --tag "$(git rev-parse --short HEAD)"
```

Verify:

```
az acr repository show-tags --name <acr> --repository gorobi --orderby time_desc --top 3
```

2. Deploy to dev runtime

```
# Runner or workflow step - refresh runtime
export IMAGE_TAG="<git-sha>"
ssh -i <key> runtime-dev.internal 'sudo /opt/compliance/bootstrap/deploy-runtime-stack.sh --tag "$IMAGE_TAG"
```

Or runtime self-pull (preferred):

```
# On runtime VM
sudo systemctl set-environment IMAGE_TAG=<git-sha>
sudo systemctl restart gorobi.container dagger.container nginx.container
sudo systemctl --failed
```

3. Promote to UAT

Step	Action	Owner
1	Open PR <code>main</code> → <code>release/uat</code> or tag <code>uat-YYYY-MM-DD</code>	Dev
2	GitHub Environment uat — required reviewer approves	Platform
3	Workflow runs on UAT runner with label <code>uat</code>	CI
4	Deploy to UAT runtime with same git-sha	CI
5	App owner smoke test	App team

Rollback (UAT): Redeploy previous git-sha from ACR (see §6).

4. Promote to prod

Step	Action	Owner
1	Tag <code>vX.Y.Z</code> on validated UAT sha	Release manager
2	GitHub Environment prod — two reviewers (platform + app)	CAB
3	Workflow on prod runner	CI
4	Deploy during change window	Platform
5	Monitor 30m — Logic Monitor + Azure Monitor alerts	On-call

Go/no-go: Security sign-off if within 7 days of prod scan.

5. Post-deploy validation

```
# Runtime VM
curl -sf http://127.0.0.1:8080/health
sudo podman ps
sudo journalctl -u gorobi.service -u nginx.service --since "15 min ago" | tail -50
```

Check	Pass criteria
Health endpoint	HTTP 200
Containers	All Up
Snowflake connectivity	Dagster job test (app)
No CRITICAL alerts	30m clean

6. Rollback

Step	Command / action
1	Identify <code>PREVIOUS_SHA</code> from deployment log or ACR
2	<code>systemctl set-environment IMAGE_TAG=\$PREVIOUS_SHA</code>
3	<code>systemctl restart <affected>.container</code>
4	Verify health
5	Open incident ticket; root-cause within 48h

Max rollback window: 4 hours after prod deploy without CAB re-approval.
